SQL concepts used:-

SELECT

WHERE

GROUP BY

HAVING

JOIN

Aggregate Functions

Subqueries

ORDER BY

LIMIT

Key Insights:-

1. The highest number of appointments was recorded in **Month 5**, resulting in the highest patient footfall during the analysis period.
2. **Saturday and Sunday** experienced the highest patient visits, indicating that the hospital should consider increasing staff availability on weekends to reduce waiting time and improve patient service.
3. **Cervicitis** was the most frequently diagnosed disease. Since it falls under the Gynecology department and the hospital currently has only one gynecologist, hiring additional gynecologists could help manage the patient load more effectively.
4. **Cancer treatment** was the most expensive treatment provided by the hospital, contributing significantly to overall billing.
5. The hospital generated a **total revenue of ₹614,450** during the analysis period.
6. Average bill amount per patient was **₹43,889**.
7. The **Surgery** department generated the highest revenue, followed by **Gynecology** and **Dentistry**, indicating that these departments contribute the most to the hospital's overall income.

Hospital Report Management Project

8. **Ankit Srivastava** was the highest-paying patient, with a total bill of ₹400,500 for cancer treatment.
